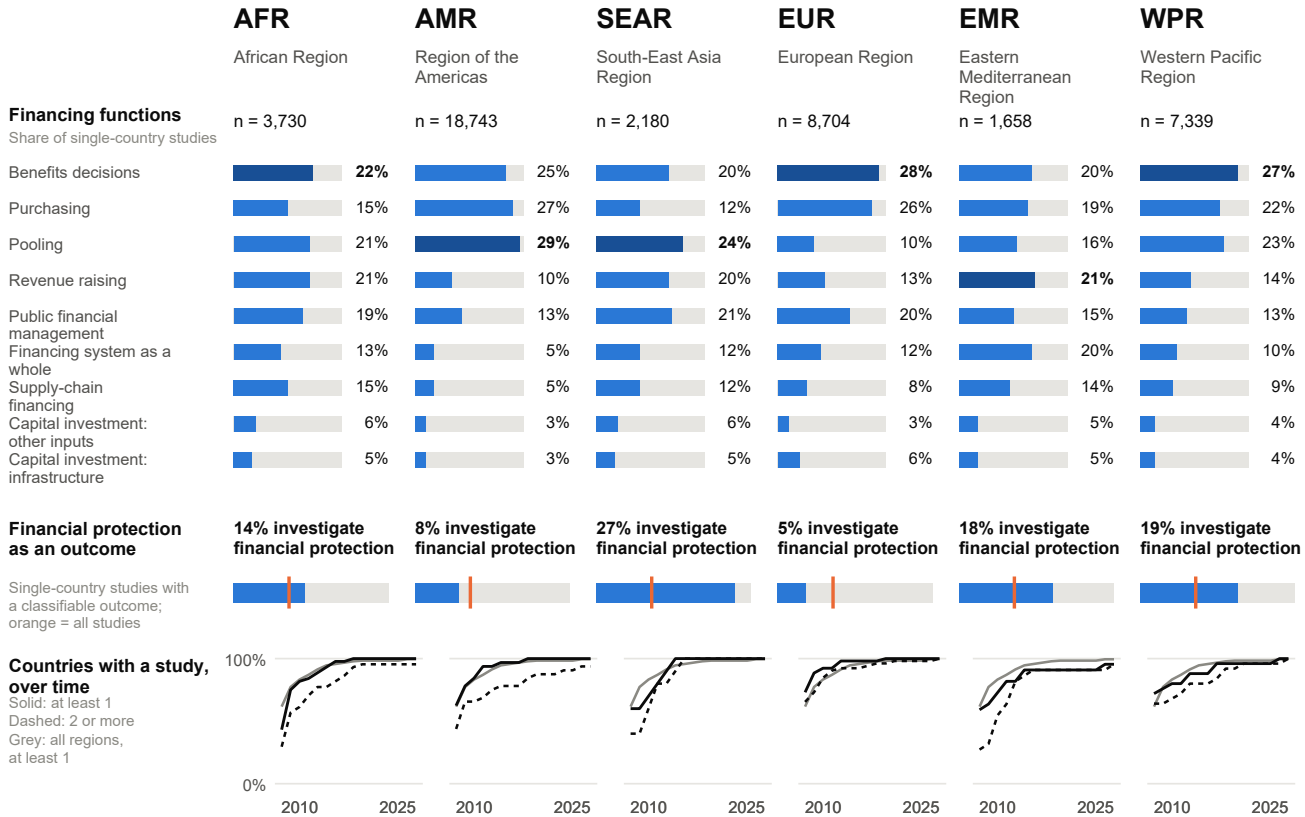
Profile of studies by WHO region

25%
of studies address benefits decisions, the most studied function

11%
of studies with a classifiable outcome examine financial protection

79%
of studies examined a single country (the base for the regional profiles)



Single-country studies; WHO regions (Taiwan and Hong Kong, Western Pacific, and Kosovo, European, which WHO does not assign, take the WHO region of their UN M49 sub-region); n = single-country studies in the region. Financing functions: share of the region's single-country studies addressing each function (as in Figure 4), on a 0-30% scale (darker bar and bold = the function studied most); a study can address several functions, so a region's shares sum to more than 100%. Financial protection: share of the region's single-country studies with a classifiable outcome (an outcome domain other than 'Unclear') that examine financial protection, on a 0-30% scale; orange marker: all 41,309 studies with a classifiable outcome (11%). Trends: cumulative share of the region's countries with at least one study (solid) or two or more (dashed); grey: all regions, at least one; 2026 is left out as incomplete. 'Other' and 'Unclear' function tags are left out throughout.
